Mental health aftershocks in focus as psychiatrists gather for pandemic summit

*Setting the stage to discuss pandemic mental health issues in Australia and New Zealand.
Photo: Sarah Carr, RANZCP*

The \$2.3 billion commitment to **mental health** in the 2021-22 Federal Budget has been widely welcomed as a major step towards fixing Australia's broken mental health system but the task ahead is huge and exacerbated by the ongoing stresses of the COVID-19 pandemic.

Many of the issues at stake for psychiatrists, from critical workforce shortages and inequities through to the existential crises of the pandemic and climate change, were on the agenda at the Royal Australian and New Zealand College of Psychiatrists (RANZCP) **2021 Congress**.

Croakey's Dr Amy Coopes and Jennifer Doggett covered the event for the **Croakey Conference News Service**. You can follow their tweets at **#RANZCP2021**.

Coopes previews the discussions below.

Amy Coopes writes:

In a year defined by uncertainty, isolation and grief, our mental health has been tested in new and perhaps unprecedented ways, and we are only now beginning to see the first aftershocks in a system already stretched to capacity to respond.

The impact of the COVID-19 pandemic on mental health were the focus of talks at the 2021 annual congress of Australian and New Zealand psychiatrists in Hobart, a COVID-era hybrid event offering a mix of live and live-streamed content for some 800 in-person attendees and hundreds more tuning in virtually from across the two countries.

It was the first time that members of the RANZCP – the Royal Australian and New Zealand College of Psychiatrists – had come together in such numbers in almost two years, with the pandemic forcing the postponement of last year's congress, an event which was to be – rather prophetically – themed **Influencing and being influenced by the world around us**.

Though the program was tweaked, not least to accommodate COVID-safe requirements around strictly capped socially distanced face-to-face registrations, the theme had been retained and only resonated more now from the pandemic, said RANZCP President Professor John Allan.

“In just about everything you do now you have to take into consideration what other people do, and the effect you might have on other people as well,” he said. “The idea of influencing has become, to me, multiplied ten thousandfold.”

The pandemic has underscored not only our interdependence and interconnectedness, but how essential these are to mental health. These conversations, which began before the coronavirus pandemic as Australia reeled from the cataclysmic 2019-20 summer bushfire crisis, thrust psychiatry and associated disciplines into the spotlight like never before.

Unprecedented pressures

Allan and his colleagues were called to educate and reassure the public on how to weather the anxiety and grief of a world in lockdown; to advocate for mentally ill people in the community at risk of falling through the gaps as services were shuttered; to work around the clock day in and out to meet demand; and to support frontline colleagues in the healthcare system. The College also had to continue supporting and delivering supervision to trainees and ensure exams went ahead, lockdown and all.

“You are called upon to respond and you have to respond,” said Allan. “We just had to keep going on with the things we would normally be doing, but in completely different forms.”

*Looking for the rainbows in COVID-19 responses. View on Hobart from the #RANZCP2021 Congress.
Photo: Sarah Carr*

In concert with many other specialist and peak medical groups, RANZCP helped realise a three-year telehealth implementation plan in the space of just three weeks, allowing locked-down psychiatrists to continue serving their patients and extending access in new and more equitable ways.

Rural and remote Australians, and those unable for mobility, safety, or other reasons to easily leave their homes, were some to benefit most from the changes, which were extended in the 2021-22 Federal Budget after lobbying by many groups, including the College.

Incoming RANZCP President Vinay Lakra, who formally took the mantle from Allan at the Congress, continued seeing clients remotely while home-schooling his children aged six and 11 during Melbourne's COVID lockdown. He says it has been both a game-changer and eye-opener for the profession, underscoring that for many – including some of the most disadvantaged and at-risk – services remain out of reach.

“It has provided better access, and that certainly has been a good news story, but it has made us aware of inequities in the system, and in a sense the pandemic has heightened some of those inequities,” says Lakra. “Even though telehealth has been helpful in addressing some of those inequities, I think there is still some work to be done.”

Key social, political determinants

As an outward-looking specialty focused on the whole person and their context, psychiatry has a particular emphasis on the social determinants of health, and these featured prominently in the #RANZCP2021 program, ranging through the “biological to the personal” and political, Allan says.

There were keynotes on hate speech and family violence, several sessions focused on Indigenous mental health and cultural safety, symposia on homelessness, patient rights, COVID-19, aged care, and a closing session on bushfires and climate change.

Allan and Lakra both consider housing, education, employment, and the criminal justice and migration systems as key determinants of mental health and important spaces for the College to advocate in.

Both had **spoken out** on the mental health impact on Australians in India, as the COVID-19 catastrophe unfolded there, from the Federal Government's threats of jail and big fines for any who tried to get back home during the travel ban.

“It adds to their psychological distress and mental ill health for them, and also too of course for people living in Australia who have families there,” said Lakra, who is among those with close personal ties to India.

“We are distressed and worried,” he told Croakey as the RANZCP called on the Federal Government to place a “humanitarian and compassionate lens” on India's disaster, to avoid being punitive and negative and to ensure Australia has sufficient quarantine capacity.

Workforce issues were also discussed at length at the Congress, with the College launching its 2021-31 Rural Psychiatry Roadmap focused on addressing significant access challenges for Australians outside of metropolitan areas, a “cycle of rural psychiatry disadvantage”.

While almost one in three Australians lives outside a major city, only 14 percent of psychiatrists practice in these areas – and this number is just 10 percent for full-time clinicians. A paucity of culturally appropriate services greatly compounds this problem for Maori, Aboriginal and Torres Strait Islander populations.

While the pandemic has deepened and brought these disparities into sharp relief, it has also demonstrated what is possible, “that we can make change in the system really quickly” when governments are committed to a common cause, says Allan.

This sentiment is echoed by Lakra:

“ When the pandemic started we invested significant amounts of money to set up additional beds, ventilators, things we fortunately didn’t need, but the government demonstrated that it was committed to do something about it, and I think the same thing is required, the same kind of commitment, to mental health.”

Allan says the profession has been surprised by some of the downstream effects of the bushfires and pandemic, particularly for young people, where there has been a spike in crisis presentations and eating disorders.

“The thing that worries me most is we have had this increase in presentations, this grumbling mental health thing in our community, and it’s not really stopping despite what people say about a recovery economically and so on. We have still got these levels of stress, particularly for young people,” he said.

“ I don’t think we actually realised the existential threat to young people that all of this has presented; the whole future of their world seemed at stake.”

If previous disasters are anything to go by, we may have some way to go before seeing the real impact in the system, with peak demand and presentations taking anywhere from 12-24 months to manifest, Lakra added, with the potential multiplier effect of the consecutive bushfire and COVID crises also a big unknown.

It is not, of course, all doom and gloom. While the past 18 months have tested us all, Lakra says they have also brought a new perspective for many: gratitude for the small things, an appreciation of our resilience and of the value of connection.

“This is a globalised world, we are not immune to things which are happening outside our sphere of influence,” says Lakra. “We are all interconnected in some way; we are not safe unless everyone else is safe in the world.”

“That’s why investment from government in a range of issues including the social determinants of health and mental health is actually important; our welfare is dependent on everyone else’s.”

.....

The Royal Australian and New Zealand College of Psychiatrists 2021 Congress, ***Influencing and being influenced by the world Around us***, was held at the Hotel Grand Chancellor Hobart and online from May 16-20.

Mental health specialists warned of rising harms of hate speech for individuals and society

Global mental health issues on stage at #RANZCP2021. Photo: Elise Carrotte

The rising harm of hate speech on mental health and society was centre-stage on the opening day of the Royal Australian and New Zealand College of Psychiatrists' 2021 Congress, which brought together psychiatrists and other mental health specialists from the two countries for four days of discussions in Hobart.

Noting that psychiatrists see daily the harrowing consequences of hate speech in their work, keynote speaker University of Queensland Professor Katharine Gelber said both individuals and institutions had a responsibility to call it out and to hold to account politicians and social media giants for their complicity.

Gelber said that, while the pendulum has swung in favour of untrammelled free speech, it is both possible and imperative for groups like the RANZCP to help restate norms and speak in support of human rights, as *Croakey* journalist Dr Amy Coopes reports below.

Coopes was covering the Congress for the **Croakey Conference News Service**. You can bookmark her stories [here](#).

See also live Twitter coverage of the event, including the opening sessions and **ten key quotes** on other issues covered during Day 1 via @CroakeyNews aka Croakey editor Jennifer Doggett.

Amy Coopes writes:

In an era dominated by populist politics and social media behemoths whose business models are built on stoking negative emotions, there has been a marked rise in hate speech, at great cost to individuals, minority communities and our democracy.

That was the message from a stirring keynote at the opening session of the 2021 annual Congress of the Royal Australian and New Zealand College of Psychiatrists, one of the first large-scale medical specialty meetings to be held in Australia since the outbreak of COVID-19.

The hybrid virtual and face-to-face Congress, themed 'Influencing and being influenced by the world around us', officially opened to some 800 in-person attendees in Hobart, with hundreds more delegates tuning in online from across the two nations.

It was the first time in two years the College had been able to gather, with the coronavirus pandemic derailing last year's proceedings, and President John Allan paid tribute to the tireless efforts of fellows and members in helping steer Australia through the unprecedented challenges of 2020.

While the pandemic had shown the power and potential of communal action, it had also been a time of isolation for many, and heightened divisions and social tensions, with reports across the globe of hate crimes targeting people of Asian descent, stoked in not-insignificant part by figures like US President Donald Trump, he said.

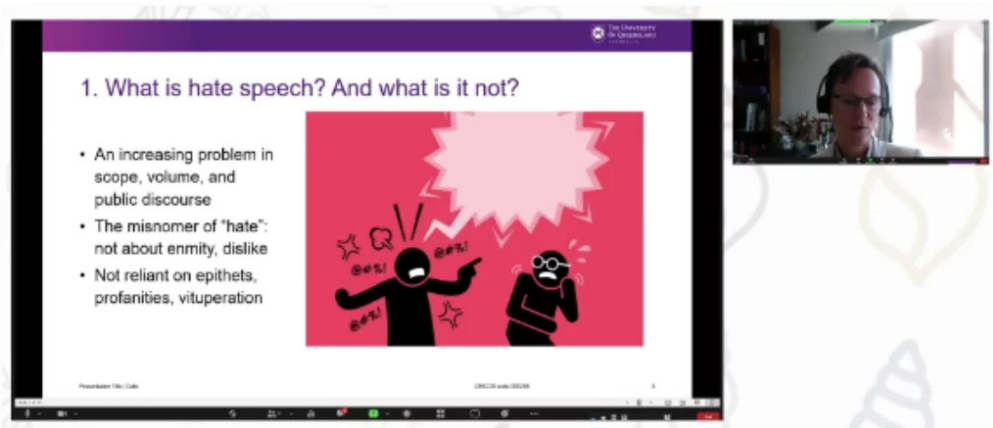

In one of the opening presentations at the Congress, Professor Katharine Gelber from the University of Queensland reflected on the rise of hate speech and its insidious impacts on psychological health and the social fabric.

Gelber, who is Head of UQ's School of Political Science and International Studies, told delegates that a combination of populist Trump-era politics and social media hegemony had seen a steep erosion of norms in recent years, with a permissiveness around expressing certain views that would have been unthinkable even five years ago.

There had been a mainstreaming of hate speech into modern political discourse by mercenary populist leaders who had seen electoral gain in stirring animosity and division, eagerly abetted by social media platforms whose business model was predicated on hate-clicks, said Gelber.

The costs were disproportionately borne by minority groups, with flow-on effects to cohesion and democracy.

Dehumanising discourses

Gelber said hate speech could harm in two ways: causally, by precipitating an act of discrimination, violence or loss of liberty, or constitutively, having such an effect merely by being spoken. Describing a particular person or group as inferior or legitimising their denigration, such as was presently being seen in dehumanising discourses around Palestinians and Gaza, was an example of the latter.

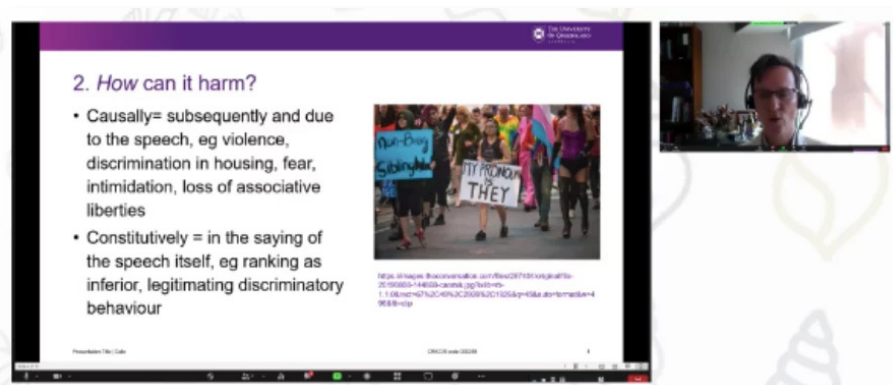

Regardless of which ways that harm was caused, Gelber said hate speech had empirically established effects.

She cited research showing it scared and disempowered its targets, leading to withdrawal, exclusion and loss of liberties, and alienating people from their own culture, language and way of life.

It had a “long, slow, cumulative effect” on marginalised peoples’ ability to express themselves, or belief they would be heard, and was a double-edged sword where fighting back invited further repercussions but repression also had consequences for people’s mental health.

“These are non-trivial, very significant harms,” said Gelber, outlining how hate speech normalised and drove discrimination, subordination, silencing, victimisation, restriction of freedom and loss of dignity. “It resets the implied rules by which public discourse happens.”

Delivering her address on the **International Day Against Homophobia, Transphobia and Biphobia** (IDAHOBIT), Gelber talked about a growing global movement of hate speech targeting trans people, and the “existential pain” of being deliberately misgendered.

Both mainstream and social media organisations played a role in this process, perpetuating tropes, fuelling stereotypes and planting seeds of contempt, Gelber said. Equally, she said, both escaped recourse for these actions.

Aided and abetted

Likening the responsibility of digital platforms to the builders of civil infrastructure like a bridge, Gelber said it was not enough to simply provide the space and accept no ownership for the consequences of it failing. She called for social media giants like Facebook to have a statutory duty of care, to be broken up into smaller, locally-accountable entities, and to face greater regulation.

Gelber described current moderation attempts, driven by algorithms and enforced by a paltry corps of staff using a one-size-fits-all reference, as doomed to fail, given that defining hate speech relied to a large extent on local context.

Instead, Gelber said the speed, anonymity and echo chambers of social media had allowed hate speech to flourish and greatly expanded the scope for targets to feel its repercussions – at school, in the workplace, in public, and even in the privacy of their own homes.

Gelber also rounded on the political class, who bore a greater responsibility given their profile and influence to ensure their free speech did not impinge on the rights of others but had decided, in significant numbers, to eschew this responsibility for short-term gain. Whole groups were excluded and discouraged from participating in democratic processes as a result, she said.

She called on individuals and institutions to step up on the issue, saying that calling out hate speech and humanising those it targeted were key to countering the toxic effects, along with 'pro-social' campaigns like New Zealand's **Give Nothing to Racism** or Australia's **Racism: It Stops With Me**, which she said served as a reminder of what agreed community standards were.

“The deep breath”: reckoning with First Nations ways of knowing in mental health

Illuminating Indigenous perspectives at #RANZCP2021. Photo Claire West, RANZCP

Lack of cultural understanding by mental health practitioners can continue to inflict grave individual and intergenerational harms for First Nations people, the Royal Australian and New Zealand College of Psychiatrists’ 2021 Congress was told.

Croakey’s Dr Amy Coopes reports below on a series of sessions on Day 2 at the #RANZCP2021 led by eminent Aboriginal and Maori mental health specialists that urged decolonisation of mental health to close the “conceptual gulf” between what is valued by Western psychiatry and in Indigenous social and emotional wellbeing.

Amy Coopes writes:

Cultural experiences and the legacies of dispossession, genocide and trauma are poorly understood and too often pathologised for Aboriginal and Torres Strait Islander and Maori people.

As a result, symptom control is prioritised over strengths and healing, with a real risk that ongoing generations could be lost to child removal, the justice system and suicide.

These were the messages of a thought provoking series of sessions at the 2021 annual Congress of Australian and New Zealand psychiatrists, where Indigenous clinicians from across the two countries called for a decolonisation of mental health systems, and a new reckoning with First Nations ways of knowing and experiencing the world.

Palyku woman and WA's Australian of the Year Professor Helen Milroy, eminent New Zealand psychiatrists Allister Bush and Mark Lawrence and *tohunga* – or Maori healer – Wiremu NiaNia, offered rare insights at #RANZCP2021 into cultural experiences of mental health in a structurally violent and dismissive Western system.

Milroy, who was Australia's first Indigenous doctor and has had a storied career in psychiatry, including as commissioner for the National Mental Health Commission and Royal Commission into Institutional Responses to Child Sexual Abuse, said Aboriginal and Torres Strait Islander peoples had a unique position as a "post-genocide population in a post-colonial society".

This historical legacy brought biological, psychological and social complexity, with multiple layers of trauma, loss and control spanning kinship groups and generations, and harms ongoing with denial of rights or access to homelands and healing.

These experiences were so universal and enduring they had become normalised, while cultural and spiritual norms extending back tens of thousands of years were problematised and misunderstood, Milroy said.

Paranormal phenomena such as seeing and hearing ancestors, communing with animals, land or weather, intuiting events and the notion of a collective consciousness were all an accepted dimension of culture and were too hastily – at times – labelled psychotic or pathologised by psychiatry. Milroy said the inverse could also be true, with illness dismissed as culture, stressing that context was essential.

Amy Coopes ✓
@coopesdetat

Replying to @coopesdetat

Don't assume what depression and psychosis is in the Indigenous context until you have lots of experience. The cultural aspects of a presentation must be checked with the original group. If you don't know, get help, never just treat #RANZCP2021

Amy Coopes ✓
@coopesdetat

Replying to @coopesdetat

If you don't know how to walk in a cross-cultural context then you cannot know what you are doing, especially in a subjective space like mental health. Need an Aboriginal frame of reference, Milroy says. Psychiatry cannot hold all the answers #RANZCP2021

Simon Stafrace
@SimonStafrace

Indigenous consumers must be approached in [#mentalhealth](#) 🌱 care with a perspective that is mindful of how western frameworks have silenced indigenous voices & an openness to cultural meaning [#wiremuniania](#) [#allisterbush](#) [#RANZCP2021](#)

Failures to engage

Bush and NiaNia shared four case studies from their work with Maori adolescents at the **Te Whare Marie** specialist mental health service, exploring how presentations of mental illness could be a manifestation of ancestral connection, *matekite* (a seer or medium), *mate Maori* (Maori spiritual or cultural problem) or other spiritual or relational disruption.

They offered a framework for psychiatrists to assess for these possibilities, asking about feelings of a presence that attended voices or visions, whether there was a personal or family history of intuiting or foretelling events, and whether their perceptions had ever been shared by others. Drawing on NiaNia's skills and experience as a *tohunga*, Bush said they had been able to distinguish many cases of culturally appropriate and explicable phenomena.

A lack of validated assessment tools for use in Indigenous populations or evidence base on efficacious treatments meant these nuances were not well understood. Milroy said this was compounded by a "language gap" or conceptual gulf between what was valued by Western psychiatry (risk and symptom control, recovery) and prioritised in Indigenous paradigms (healing, strengths).

There was also a failure or unwillingness to engage with the unfinished business of sovereignty, land rights, compensation, reconciliation and national identity – issues that, if addressed, would have a lasting and tangible impact on mental health, Milroy said.

"I don't know what it is going to take, but we can't allow this to continue," said Milroy. "We are at risk of losing generations to out of home care, to the justice system and to suicide".

Amy Coopes ✓
@coopedetat

Replying to @coopedetat

How do we adapt our practice to bring cultural practice and frameworks into mainstream services, asks chair Marshall Watson. Milroy says we have a long way to go to this, need to build up and showcase evidence base. And greater cultural safety needed as starting point [#RANZCP2021](#)

She said the only way forward was genuine partnership, that it was no longer sufficient to champion change; it had to be built into the service provision model. Milroy recalled the words on Closing the Gap from former Aboriginal and Torres Strait Islander Social Justice Commissioner Tom Calma, who said it was not credible that one of the wealthiest countries in the world could not solve a health crisis affecting less than three percent of its citizens.

At the policy level, Milroy said there had been dramatic changes in recent years, with more organised and more unified advocacy from Indigenous groups and a much greater capacity in the space for expertise and partnership.

She pointed to the launch of **Gayaa Dhuwi** and formation of the **Coalition of Peaks** as significant steps, along with the proliferation of Indigenous-specific professional bodies like the Australian Indigenous Doctors Association, Indigenous Allied Health Association, Congress of Aboriginal and Torres Strait Islander Nurses and Midwives, and the National Association of Aboriginal and Torres Strait Islander Health Workers and Practitioners (NAATSIHWP).

Milroy said there was a greater emphasis on Indigenous governance and longer policy cycles, but a “glass ceiling” remained. There were significant problems in the mental health space at the interface between primary care, social and emotional wellbeing and mainstream services, with a lack of cohesion and collaboration, cultural safety, inclusion or valid assessment tools and outcome measures.

Workforce issues loomed large, with over-reliance on low-paid Aboriginal staff who were not offered professional development opportunities and were expected to take on roles far beyond their training, Milroy added.

Courageous wisdom

Presenting from across the Tasman, Lawrence offered a story of *Whenua, Te Reo me Aroha* – land, language and love – around Maori knowledges and experiences of colonisation. He spoke about the importance of words in constituting and framing the lives of people, communities and societies, and of place, agency and mana.

Lawrence called for a decolonisation of health, something he described as a process of learning and relearning what had been lost, of truth-telling, positive change, achieving equity. This required *me hoki whakamuri, kia anga whakamua* – looking back to see our future, he said.

“Structures must change to reflect the place and the people of that place,” said Lawrence, urging his psychiatry colleagues to be part of the change. “It’s your legacy, it’s my legacy.”

He hailed the announcement of the new independent Maori Health Authority, chaired by Mason Durie, as a monumental step, and the culmination of many years of advocacy, with tremendous will from both government and the medical profession.

Lawrence closed his presentation with an excerpt from Moana Jackson's 'Imagining Decolonisation', which he said was essential reading for anyone working in health care.

"It will require courageous wisdom to change, and some will say it is impossible and unrealistic. But when the ancestors crossed Te Moana-nui-a-Kiwa, they overcame what seemed impossible and realised that courage is simply the deep breath you take before a new beginning."

The way forward is genuine partnership, no longer sufficient to have champions, it must be built into service provision model. Historical trauma casting a shadow and one of the things we can actually shift by engaging with it [#RANZCP2021](#)

Ways Forward

- Genuine collaborative partnerships between mental health services and ACCO's
- Bring SEWB model into mental health
- Embed and develop trauma competence and cultural safety
- Shared vision, responsibility and accountability
- Valued relationships
- We can all do this

Amy Coopes  [@coopesdetat](#)

Replying to [@coopesdetat](#)

Great progress in some areas, others getting worse. Improvements still slow, even with relevant policy in place. 'I don't know what it is going to take but we can't allow this to continue at risk of losing generations to out of home care, juvenile justice & suicide' [#RANZCP2021](#)

Current situation

- Currently we have great progress in some areas while other indicators are getting worse
- Even with good policy, system reforms and legislation, improvements are slow
- We are still in danger of losing generations to OOHC, juvenile justice and suicide

COVID-19 and mental health: moral and logistical challenges and an ongoing toll

*NSW chief psychiatrist Murray Wright presents to the #RANZCP2021 symposium on COVID-19.
Photo: Sarah Carr*

The impact of COVID-19 hovered over many sessions and the staging of the Royal Australian and New Zealand College of Psychiatrists' annual Congress in Hobart, one of the first medical specialty conferences to meet once again in person.

The pandemic's impact was centre-stage at a high level trans-Tasman panel session at a **#RANZCP2021** Presidential Symposium. It heard that, while the worst projections were averted in both Australia and New Zealand, the pandemic has inflicted a high and continuing toll on mental health, particularly for young people.

New Zealand's COVID-19 experience came amid a series of ongoing "psychosocial crises", in the wake of tragic events like the Christchurch earthquakes and mosque massacre and, as did Australia's, underscored the critical importance of the social determinants of health, including income support.

Amy Coopes writes:

The worst-case predictions of a pandemic-fuelled surge in suicide did not come to pass, but demand on an already-ailing mental health system has ballooned, with no signs of abating and warnings to psychiatrists that it could be years before we pass the peak.

And while a swift pivot to telehealth was hailed as life-changing for many, it had been far from a panacea, highlighting and exacerbating access disparities and placing a new level of strain on practitioners, the Royal Australian and New Zealand College of Psychiatrists' annual Congress has been told.

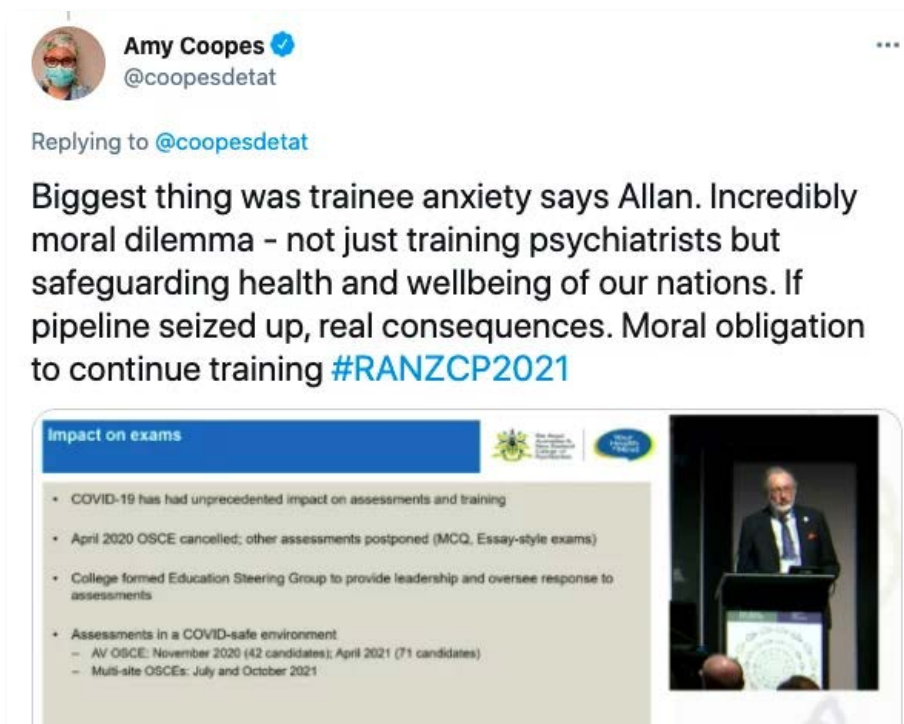

The coronavirus pandemic was front and centre at the RANZCP Congress, themed 'Influencing and being influenced by the world around us' and one of the first major medical specialty conferences to be held in Australia since the global outbreak began.

It highlighted how mental health has come under the spotlight as never before in an unprecedented year of isolation, loss, uncertainty and rapid change, throwing many of the givens in our modern life into question.

RANZCP President Associate Professor John Allan said it had posed a "moral challenge" to the College to ensure training continued, because the mental health and wellbeing of Australia and New Zealand was at stake.

Allan chaired a symposium examining the impact of COVID-19 on mental health across the two countries, featuring Australia's deputy chief medical officer for mental health, Dr Ruth Vine, New South Wales chief psychiatrist Dr Murray Wright, and Dr Arran Culver, who is chief clinical advisor for mental health and addiction to New Zealand's Ministry of Health.

The group shared their experiences of working behind the scenes on the coronavirus responses of Australia and New Zealand, widely regarded as among the world's best, with very few infections or deaths in relative global terms.

Planning for system collapse

Dr Murray Wright gave an insider's account of the NSW response, emphasising the importance of information, adaptation, communication and collaboration.

More than 12 months on, with millions of vaccine doses administered and little local transmission to speak of since the suppression of Melbourne's second wave, Wright said it was easy to forget where we had been, mired in incredibly grim forecasts and "contemplating health system collapse".

Based on the information out of China and other outbreak centres, NSW was expecting some 25,000 deaths and a 10-week ICU surge maxing out capacity by more than 300 per cent.

It made plans for a massive 550-bed makeshift hospital at Olympic Park, with further field hospitals at the Sydney Convention Centre and Gore Hill Oval. Scrambled contingency plans looked at turning frozen food factories, industrial warehouses and even pubs into makeshift morgues – contemplating a city under siege, “like the aftermath of a war zone”.

Amid a “cacophony of voices about what was going on, some of which was pretty unhelpful”, Wright said it soon became obvious just how important, “consistent, clear and realistic” messaging from government was going to be, and an enormous upskilling of communications capacity became an early priority.

Information was a precious commodity, particularly in those early days, and Wright said a confidential team of analysts known as the Critical Intelligence Unit was at the heart of NSW operations, combing through media reports and scientific publications to keep officials abreast of the latest developments.

They were “completely invisible to the rest of the community, but vital” to the government’s COVID-19 strategy, producing a daily evidence digest, updating the internal Risk Monitoring Dashboard and public-facing Agency for Clinical Innovation (ACI) sites Living Evidence and Evidence Check.

Specific to the mental health space, Wright said NSW Health’s System Information and Analytics branch published MH Trace. It tracked indicators of demand and capacity in the system such as Emergency Department presentations with mental health concerns, suicidal ideation or self harm, Medicare Benefits Schedule (MBS) mental health service use, and crisis line contacts, with data distillable down to local health district (LHD) and health service level.

Offering a glimpse inside the government’s clinical war-room, Wright discussed the formation of the NSW COVID-19 Clinical Council, a group bringing 30 specialist areas together weekly with bureaucrats to discuss health system priorities in the response.

Wright said personal protective equipment (PPE) became a “lightning rod, a proxy for anxiety – for health care workers in particular, and rightly so”, and there was a high level of distress and distrust around these and other issues in a “pretty torrid” first month.

Overtime the Clinical Council came to be an effective and important plank of the NSW response, he said, also applauding the formation of National Cabinet, which he said was not only valuable in coordination but allowed information-sharing and collaboration.

At a specialty level, Wright said the nation’s chief psychiatrists also met monthly throughout the pandemic and this allowed for peer review and debriefing across jurisdictions, and discussion of common challenges.

Telehealth and the social determinants

The major and persisting issue confronting the mental health system was increased emergency department presentations by young people, Wright said – a concern echoed by Dr Ruth Vine and by Dr Arran Culver from across the Tasman, a former child psychiatrist, who said it was borne out nationally and trans-nationally, along with a rise in this group of eating disorders.

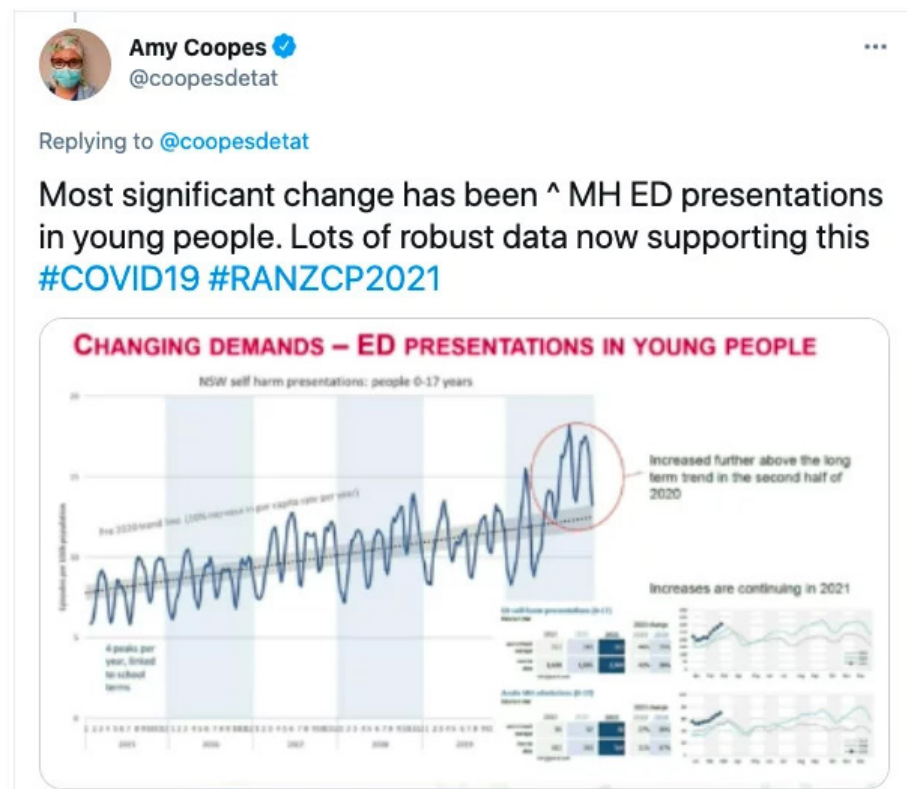

Vine's position as deputy chief medical officer for mental health was created by the Federal Government in response to the pandemic, amid frightening prediction early on of an “explosion” in suicides.

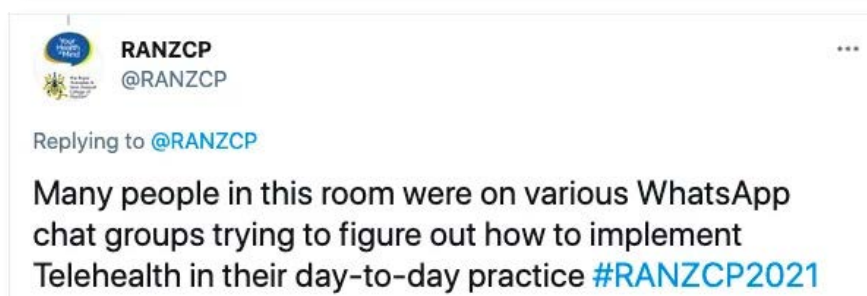

While that didn't eventuate, she said concerns about the system's ability to cope pre-dated COVID-19, which had not arrived in a vacuum for Australia's mental health services – already stretched to the limit by growing demand, complexity, fragmentation and inequities of access.

While the system and some of its users benefited from a pandemic-expedited telehealth rollout, Vine said it hadn't helped everyone and made things more difficult for those without access to a safe, private place to be seen or a secure platform.

This was recognised early on by New Zealand, according to Culver, who said the government reached a ‘zero data’ agreement with the nation's telecommunications companies to allow for free access to COVID-19 related information and services, and engaged in a mass buy-up and distribution of cheap mobile handsets to disadvantaged communities.

Vine said more beneficial and significant for mental health during the crisis were ‘non-health’ interventions like JobKeeper, targeting the social determinants of wellbeing.

Longer-term psychosocial alert

Culver shared similar experiences from New Zealand, where he said there was early recognition – informed by a series of national disasters in preceding years including the Canterbury earthquakes – that the major impacts were not going to be viral. Rather they would be on people's lives and livelihoods: income, food security, housing, employment and family and the exacerbation of family and domestic violence by conditions of confinement.

Culver said New Zealand had actually been in psychosocial crisis response activation mode for most of the few years preceding COVID due to crises including the earthquakes that hit the Christchurch region, the White Island volcano eruption and the Christchurch massacre. Still nothing had quite equipped them for a national pandemic response, he said.

While New Zealand had escaped any major primary impact from COVID-19 itself, Culver said there had been "significant secondary and economic impacts, but these were managed reasonably well".

The country's updated psychosocial response plan had a stronger focus on the social determinants of health and at-risk groups, including the newly unemployed, people who were already in hardship, and children and young people.

This latter group had been demonstrated as the most vulnerable to mental health impacts following the Canterbury earthquakes, Culver said, with a delay in onset of about six months and a "very long tail", in the order of about three years.

New Zealand had seen a similar COVID-19 spike in youth mental health presentations, but he said this had peaked after about 6-8 weeks.

Vine questioned when, if ever, the surge in demand seen during COVID-19 would abate, given it was showing no signs of slowing in Australia.

Adding to this, Culver said there were new challenges ahead, with a current phase of 'languishing' and fatigue with eradication measures that were now bringing diminishing returns, and a new kind of psychological readiness needed around COVID endemicity as borders began to open.

Culver paid tribute to a "remarkable" public response in New Zealand to date, which he put down to a unity and clarity of messaging – a "single source of truth" – compared to other jurisdictions.

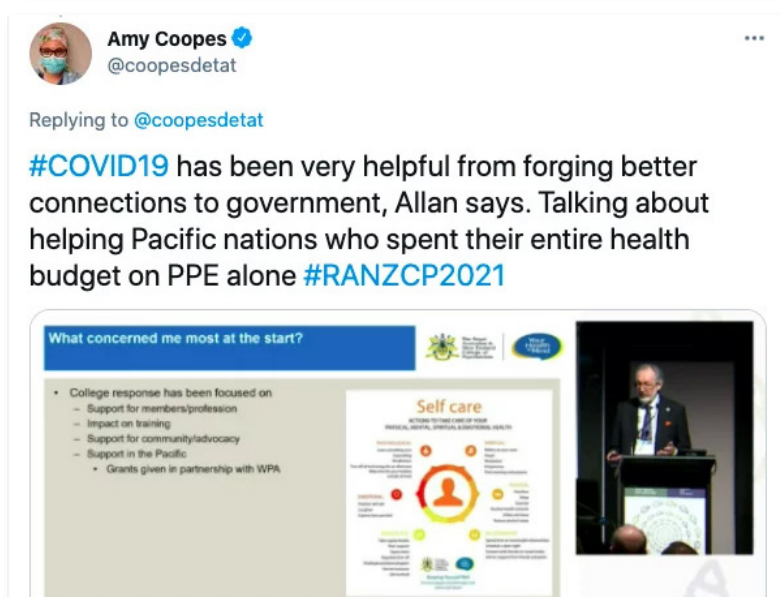

The panellists were asked to comment on the role of the media, and whether they had helped or hindered.

Largely, Vine said media outlets had been responsible, for example not blowing the suicide modelling early on out of proportion.

Wright agreed they had been quite respectful of health authorities' role as the "voice of truth, especially in critical stages", and urged his colleagues to reflect on what had been done well. Overall, he said, the response was one health care workers should be proud of.

Big questions for mental health on the agenda at #RANZCP2021. Photo: Dr Astha Tomar

Introduction by Croakey: Is hope on the way for mental health system reform?

That was one of the bigger issues on the agenda at the 2021 Royal Australian and New Zealand College of Psychiatrists (RANZCP) Congress, in the wake of major mental health system investigations by the **Productivity Commission** and Victoria's **Royal Commission**.

The question may have got one answer on its closing day, as the Victorian Government announced what's being hailed as an historic commitment of \$3.8 billion over four years in response to the Royal Commission's findings and recommendations.

It outstripped the Federal Government's record \$2.3 billion mental health budget announcement and prompted mental health expert Professor Patrick McGorry to **say** he "never thought I would live to see the day mental illness would be the heart of a state budget".

The RANZCP welcomed the funding as underscoring the central premise of the Royal Commission, "that every person has a right to appropriate and effective mental health care, whenever and wherever they need it".

Some of the asks for mental health reform from psychiatrists and other mental health specialists are outlined in this big omnibus post from #RANZCP2021, that features tweets from a number of sessions and participants across the four days of the Congress.

As well as reflections on the big mental health inquiries and takeaways from Day 3 from Croakey journalist Jennifer Doggett, it includes tweets from sessions on alcohol and mental health, therapeutic inpatient services, intellectual disability and mental health, and some selfies, snaps and snapshots from around #RANZCP2021.

The Congress also marked the handover of the College presidency from Associate Professor John Allan to Associate Professor Vinay Lakra, who said his main priorities will include training and workforce issues and advancing psychiatry's voice in the mental and physical health sectors.

He said that, as the first RANZCP President to have trained overseas, he also aims to "encourage and promote cultural diversity, equity and inclusion in access to mental health services".

Ajay Vijayakrishnan
@piperlongum

#RANZCP2021 Congratulations to @DrVinayLakra, our new President. A momentous occasion for psychiatrists of all ethnicities in Australia, New Zealand and beyond!

“It was personal. It was now. It was the future.” The mental health toll of climate disasters

Artwork by Elizabeth Gleeson

The critical need for the Australian Government to put **climate health** on the agenda was clear from a powerful session on the mental health toll of bushfires and climate change at the 2021 annual Congress of the Royal Australian and New Zealand College of Psychiatrists (RANZCP) in Hobart.

The conference coincided with the launch of a new International Energy Agency report, **Net Zero by 2050: A Roadmap for the Global Energy Sector**, warning that we are approaching a decisive moment for international efforts to tackle the climate crisis, but with huge health dividends if we act.

The report highlights the massive health benefits from tackling carbon emissions and air pollution, estimating the potential for lower inside and outside air pollution to roughly halve premature deaths in 2050 compared with 2020, “saving the lives of about 2 million people per year, around 85 percent of them in emerging market and developing economies”.

Amy Coopes writes:

As the climate emergency advances and intensifies, bringing ecological grief and existential angst about human survival, Australian and New Zealand psychiatrists have been warned the mental health of coming generations will be tested as never before by the cumulative and rolling impacts of disasters.

These effects will include post-traumatic stress disorder, depression, anxiety, substance use and explosive anger leading to family and domestic violence, and social cohesion will be central to staving off the worst of its effects, the annual Congress of the Royal Australian and New Zealand Psychiatrists (RANZCP) was told in Hobart.

The unparalleled 2019-20 Australian bushfire crisis and precipitating climate emergency were the focus of a closing symposium at the conference, which is among the first major medical specialty meetings to be held in Australia since the eruption of the coronavirus pandemic.

The lessons of previous Australian disasters including longitudinal findings from survivors of the 2009 Black Saturday bushfires in Victoria were discussed, along with reflections from the frontlines of last summer's fire emergency.

With these sorts of events expected to increase both in frequency and intensity over coming decades, understanding and anticipating the mental health impacts would be essential to both preparedness and recovery, the session heard.

Cumulative and compounding events

Dr Murray Wright, chief psychiatrist of New South Wales, offered a glimpse behind the scenes of the State Government's response to the 2019-20 bushfires, a national crisis which claimed 33 lives, destroyed more than 3,000 homes and shrouded Australia for months in a pall of toxic smoke.

Wright said the emergency was unprecedented in a number of ways. First was its sheer scale, impacting almost half the state's local health districts and lasting for many months – with the first fires igniting in September 2019, and the final blaze not extinguished until the following March – and communities shifting along the spectrum to recovery at their own speed in that time.

Perhaps more important, and a harbinger of what we could expect in an era of climate crisis, was that New South Wales was already in disaster mode when the fires hit, grappling with the worst drought in living memory – with many of the same communities affected.

Replying to @coopesdetat

Wright referring to Emotional Lifecycle of a Disaster (lots of airtime in various presentations this week) but says in NSW an important caveat - when [#bushfirecrisis](#) hit was on back of worst drought in living memory. 'We were not pre-disaster, we were in a disaster' [#RANZCP2021](#)

Rather than the typical emotional trajectory of a disaster, Wright said these cumulative and compounding events had seen a “staccato decline in function” for affected populations. From the outset, he said it was obvious which communities would struggle most, with social cohesion a key predictor of risk.

For the government, the scale and length of the crisis – involving an unprecedented three successive state of emergency declarations in November and December 2019 and January 2020 – posed new challenges around deployment of mental health response crews including where they were drawn from and how long they were dispatched for, Wright said. These groups swiftly went from being seen as heroes on the ground to becoming targets of anger at governments, and Wright said there were also safety and access questions for response crews as the fires burned on in some areas for many weeks and months.

One of the key lessons Wright said had been drawn from last summer's events was that psychological first aid training was essential for every single person involved in disaster response, from frontline workers up.

“Because the levels of community distress we experienced were everywhere, and everyone,” Wright told the symposium. “The whole of the South Coast was traumatised.”

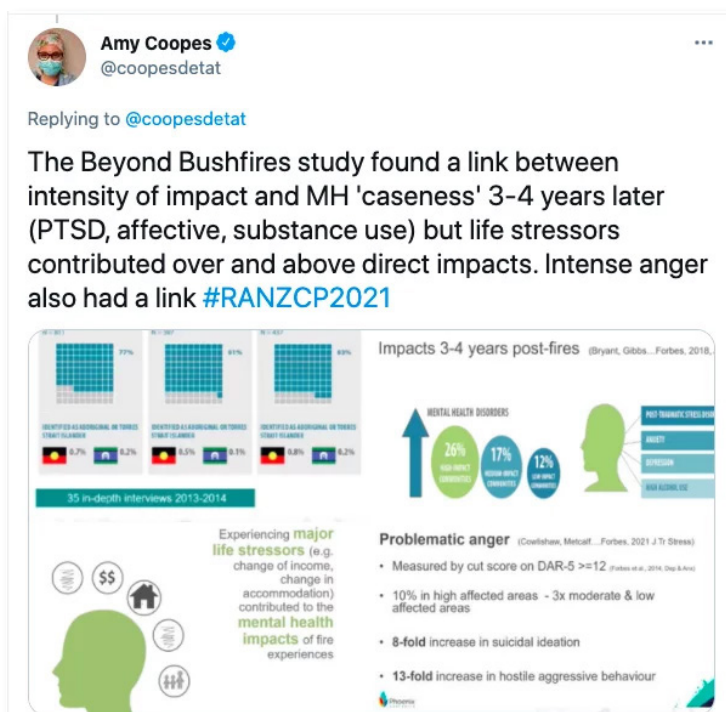

In an era of increasing disasters, Wright said the government was also considering formation of a volunteer corps, like the NSW Rural Fire Service (RFS), of mental health respondents, drawn from private practice and retired psychiatrists, and establishment of permanent recovery clinicians in rural and regional areas.

Impact of subsequent life stressors

Drawing on data from the Beyond Bushfires longitudinal study of Black Saturday survivors, David Forbes, from the Phoenix Australia Centre for Posttraumatic Mental Health, took delegates through some of the mental health and associated impacts of disaster.

Not everyone responded the same to a crisis, Forbes said, and this was determined by factors preceding, linked to, and following the event.

The Beyond Bushfires study demonstrated a link between intensity of the original disaster impact and later mental health ‘case-ness’ for things like PTSD, anxiety/depression and substance use in the ensuing three to four years, with rates of 26 percent in the worst-affected communities, 17 percent in moderately impacted areas and 12 percent in low-impact zones.

Problematic anger and its sequelae, including hostile aggressive behaviour (13-fold increase in worst-affected areas), and suicidal ideation (8-fold increase), were also linked to disaster intensity. Anger translated directly into increased family and domestic violence, with 7.4 percent of women in the worst-affected communities reporting experiencing violence in the 12 months after Black Saturday, Forbes said, an “extremely worrying” phenomenon.

However, Forbes said subsequent life stressors, particularly threats to financial and housing security, determined “above and beyond” the original impact, whether people went on to experience adverse mental health effects. This highlighted the importance of long-term financial and other forms of support to mitigate mental health effects, he said.

Ten years after Black Saturday, Forbes said levels of PTSD dropped off but depression and substance use was unchanged. In the worst-affected areas, 10 years on, he said 22 per cent of people were still experiencing PTSD, depression or severe distress, and this was associated with extent of original property loss, and subsequent traumas or stressful life events. Only a quarter had sought professional help in the preceding six months.

“When we’re talking about climate change, we’re talking about trauma on trauma on trauma, and what we see in this dataset is, over the course of ten years, these factors accrue,” Forbes told the forum.

Though the study had not specifically examined the impact of COVID-19, as it had occurred outside the research period, Forbes said it had been a confounder to recovery, undermining social cohesion through fear, uncertainty and perceptions of risk as well as via government-mandated distancing and isolation.

Heightened existential angst

Children and young people had been among groups whose mental health was worst affected by the pandemic, with data presented earlier at the Congress showing a rise in youth crisis presentations to emergency departments and increasing eating disorders.

They were also the group likely to be most vulnerable to adverse psychological impacts of the climate crisis, the session heard.

Eminent Australian child psychiatrist Dr Brett McDermott shared his experiences across several decades working in Australia and elsewhere with young disaster survivors.

He said there was “palpable” child and adolescent angst about the climate crisis and, as it accelerated, bringing more frequent and overlapping acute single-event traumas, this ‘heightened existential angst’ would leave a whole generation more vulnerable to adverse mental health impacts.

He condemned a “perfect storm” of politically-controlled media coverage and government inaction for downplaying “strong grassroots angst” in the community about the climate emergency.

In the final presentation of the day, psychiatrist-psychotherapist Dr Charles Le Feuvre, who is executive director of the non-profit Psychology for a Safe Climate, discussed his work on eco-distress. It has involved counselling those “who have grieved over loss of land to drought, who grieved over the loss of so many beings in the bushfires; those who fear rising sea levels and diminishing ice, and those who fear human extinction”.

He described the 2019-20 bushfire crisis as a ‘double trauma’, razing huge tracts of Australia and cloaking the nation in a smoke haze that was “a global memorial to humans, other living beings and places we loved but had lost.”

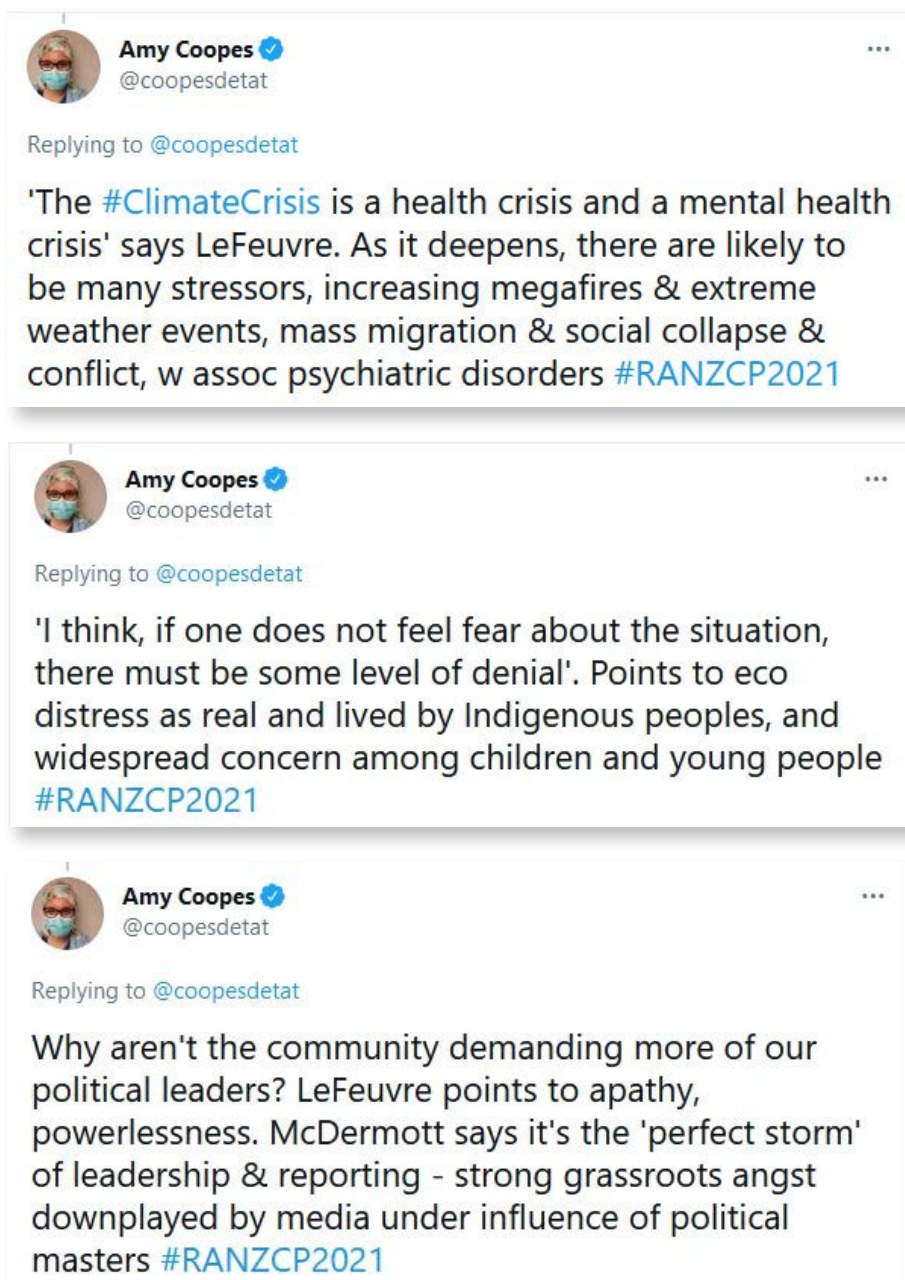

“It was a global fire alarm for a climate emergency,” Le Feuvre said.

While many people had accepted the reality of climate change, he said there was widespread denial of its implications – megafires, extreme weather events, mass migration, conflict and social collapse – with people instead retreating into a bubble of apathy. “The fear and grief can be overwhelming when this bubble bursts,” he said.

Le Feuvre described a growing sense in the community of ecological grief for a “loss of species, ecosystems and meaningful landscapes”, and eco-anxiety, “watching slow and seemingly irrevocable impacts unfold and worrying about the future”.

He said children and young people were particularly vulnerable to these feelings, with a sense of powerlessness and apathy, entrenched through decades of political intransigence, resulting in profound angst with no outlet.

A shared sense of purpose – hope emerging through the process of engagement and action – was one way to combat these. He pointed to the value for mental health of engaging in the school strikes for climate and urging “strong, realistic yet compassionate leadership” from those in power to provide “moral direction in the face of uncertainty and insecurity”.

Psychiatrists must challenge structural drivers of family violence and their own roles in trauma

Putting women's safety on the agenda, including for mental health. #March4Justice rally, Brisbane.
Photo by Stewart Munro on Unsplash

Introduction by Croakey: The shocking **coronial finding** that Ambulance Victoria had left a family violence victim to die has again showcased failures in the health system itself to understand the nature and effects of harm caused by family violence.

It came alongside **criticism** from a range of Aboriginal and Torres Strait Islander women academics, activists and frontline workers who say that calls to criminalise coercive control as part of strategies to address family violence fail to understand how the state itself perpetrates abuse and coercive control over Indigenous women and that criminalising coercive control would result in more Indigenous women being imprisoned than protected.

With demands for action on abuse of women dominating headlines in Australia, the **Congress** of the Royal Australian and New Zealand College of Psychiatrists (RANZCP) focused in a number of sessions on the intersection between family violence and mental health.

It was told the sheer scale of childhood trauma was such that psychiatrists should assume “every one of their patients” had been touched by abuse in some way, and that it was incumbent on them to challenge the conditions that perpetuate violence in society and to scrutinise their own part in these equations.

Croakey journalist Dr Amy Coopes reports on these #RANZCP2021 discussions below, and from another session on homelessness and mental health. Find all of our stories from the Congress [here](#).

Amy Coopes writes:

Psychiatrists have a responsibility to challenge the social determinants of violence, not merely treat its survivors, and to grapple with political and structural forms of trauma, a peak meeting of mental health specialist doctors heard.

Domestic and family abuse and trauma were prominent topics at the 2021 **Congress** of the Royal Australian and New Zealand College of Psychiatrists (RANZCP) in Hobart.

Carole Warshaw, director of the US National Center on Domestic Violence, led a number of sessions looking at domestic violence and its sequelae, with an emphasis on the social and political contexts in which it occurred, including the health system, and the need for trauma-informed, social justice responses.

The discussions were timely given the ongoing focus in national debates around gendered violence and abuse — including in the Australian parliament — given prominence by survivors **Brittany Higgins** and Australian of the Year **Grace Tame**, as well as journalist Jess Hill's Stella Prize-winning *See What You Made Me Do*.

Dr Karen Williams, an expert in complex trauma and gender-based violence, put things into sobering context, saying that one in four Australian adults are survivors of childhood trauma, about half of which was emotional abuse, a quarter was neglect, 18 percent was physical abuse and 12 percent was sexual abuse.

The sheer scale was such that she told colleagues they should assume every one of their patients had been touched by abuse in some way, and open therapeutic opportunity for these disclosures.

@venessb

How domestic violence impacts mental health. New data from Australia being presented by Carole Warshaw
[@ncdvtmh](#) #RANZCP2021

The burden fell disproportionately on women and children, with one in four Australian women experiencing at least one incident of intimate partner violence and one in five enduring sexual violence in their lifetime. Every two hours in Australia, Williams said a woman was hospitalised by an intimate partner, and one-third of all family violence hospitalisations were children. One quarter of these children would have a brain injury, she said.

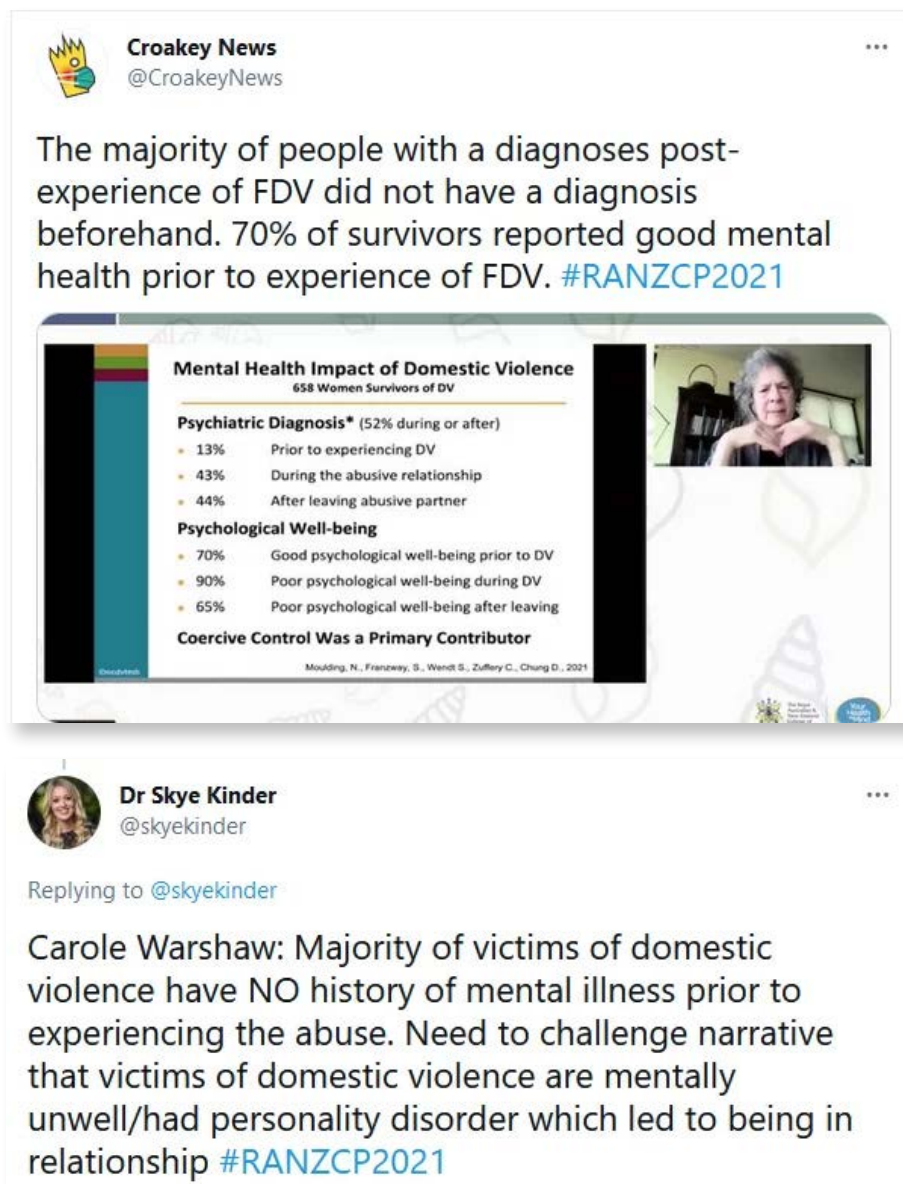

Even if they weren't directly targeted, Williams said the impact on children was significant. More than two thirds of women who experienced violence said it had been heard or witnessed by their children. Family and domestic violence was linked to prematurity and low birth weight, neglect, and a range of mental health issues including ADHD, oppositional defiant disorder, conduct disorder and mood and anxiety disorders.

In economic and social terms, the cost was immense, with a conservative annual pricetag of \$26 billion due to lost productivity, imprisonment, homelessness and other impacts including to health, Williams said.

For women aged 25-44, intimate partner violence was Australia's leading cause of morbidity and mortality, she added, with more than one woman killed every week by a current or former partner and an untold quantum of other impacts including early pregnancy loss, physical injuries such as bruises, fractures, lacerations and burns, and brain injury – which Williams said was often under-recognised.

Domestic abuse was also associated with a range of other conditions including allergies, bronchitis and asthma, bowel problems, hearing and eyesight problems, anaemia, cardiovascular issues and cervical cancer, Williams said.

There were also obvious impacts to mental health, with one Australian study showing more than half of women with a history of domestic abuse had received a mental health diagnosis, including anxiety, depression, sleep disorder, substance use and PTSD. Importantly, and contrary to received wisdom, she said the vast majority of these were made during or after the relationship, with only 13 percent being diagnosed before the abuse.

Power imbalances and abuses

These statistics were echoed by Warshaw, who said they disproved a common misunderstanding that survivors of abuse were somehow predisposed to enter damaging relationships by virtue of their mental health. In fact, in the study population she said 70 percent reported good psychological wellbeing prior to the abuse.

Warshaw pointed to the importance of social determinants such as poverty and housing security, institutionalisation and reliance on caregivers in exacerbating the risk of abuse, and highlighted that historical and intergenerational trauma and political and structural violence – including by medical institutions and practitioners like psychiatrists – were often overlooked, underestimated or misunderstood.

This was particularly true for Indigenous peoples in North America and Australia, where there was an epidemic of murdered and missing women, and for migrant populations. Warshaw said the legal, migration and health care systems were too often at the intersection of abuse. Discrimination, racism and homo/transphobia all contributed to trauma risk.

Given this, she said it was incumbent on psychiatrists to challenge the conditions that perpetuated violence in society, whether that be political and economic structures, or the social, cultural and institutional drivers. She also urged delegates to remember that they could often be part of these equations, and to be mindful of the power imbalances at the heart of coercion, control and abuse.

Rather than a linear relationship, Warshaw said mental health, substance use, trauma and abuse had a kind of wicked symbiosis, each in turn increasing the risk and harms of the other. She spoke at length about the ways in which mental health issues and substance use were weaponised by abusers, aided and abetted by systems that were meant to protect.

Overall, Warshaw said intimate partner violence increased the risk of PTSD, major depressive disorder, self-harm and psychotic symptoms threefold, quadrupled the risk of suicide attempts and increased substance use disorder risk six-fold.

She also reflected on the impact of COVID-19, saying intimate partner violence had been more frequent and resulted in more severe injuries during the pandemic, and cut people off from supports. It had also posed particular therapeutic challenges, when survivors were trapped in lockdown with controlling and abusive partners, with the rise of telehealth.

Warshaw offered clinicians a range of tips for working with survivors and broaching difficult subjects, urging colleagues to focus on building mutuality and trust rather than offering solutions or analyses, and to sit with the fear and uncertainty of the work. Focusing on strengths was critical to helping rebuild someone stripped away by coercion and abuse.

Release from prison, loss of public housing tenancy, gambling problems or discharge from a psychiatric facility were some of the common pathways to homelessness, Burns says [#RANZCP2021](#)

Amy Coopes @coopedetat

Key findings [#RANZCP2021](#). People with severe and persisting mental illness who were homeless were particularly disabled. Failures of government policy, esp around housing [#RANZCP2021](#)

Substance use and homelessness

- 66% substance use disorder
- 85% cigarette use
- Complex relationship between drug use, mental illness and homelessness
- Substance use can be cause and consequence of homelessness
- Poor access to treatment programs

Imprisonment and Homelessness

- 28% released from prison to homelessness
- High rates of psychiatric illness in prisons (27%)
- Problems obtaining and maintaining tenancy on release
- 'Continuum coordinated model of care' (CMCC) collaboration between CSL, RSH Health, and Housing, Premier's initiative to reduce recidivism rates

Tackling workforce distribution and diversity to deliver on mental health reform

With an Albany backdrop, Dr Phoebe Thornton featured in an RANZCP promotion for more trainee psychiatrists to work in rural and regional areas

In her final report from the 2021 **Congress** of the Royal Australian and New Zealand College of Psychiatrists (RANZCP) in Hobart, Croakey journalist Dr Amy Coopes looks at workforce issues, including the launch of a ten-year Rural Psychiatry Roadmap.

This post also includes insights via Twitter on #RANZCP2021 sessions on lived experience of mental health issues in the mental health workforce and patient rights, and it wraps Croakey's coverage with analytics from the event, which was one of the first major medical specialty events held face-to-face since the outbreak of the coronavirus pandemic.

Amy Coopes writes:

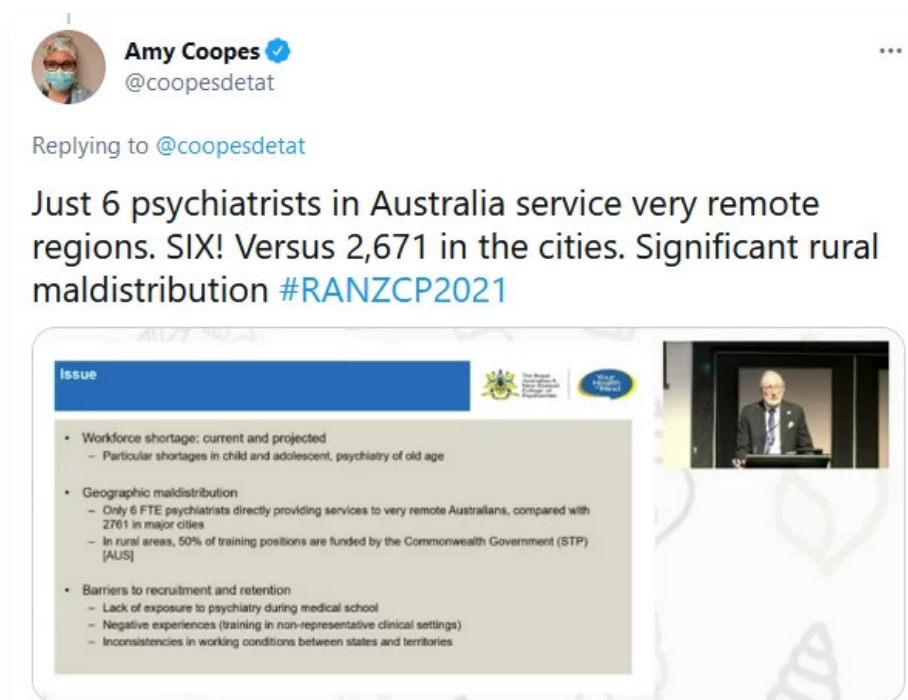

Mental health care is at a crossroads in Australia, with immense appetite for and momentum towards reform, but lofty aspirations will remain out of reach without significant investment in and reimagining of the workforce, a recent summit of psychiatrists has heard.

Diversifying the mental health response workforce and shifting the training paradigm to have greater focus on rural and remote areas were some of the big-ticket items discussed at the Congress of the Royal Australian and New Zealand College of Psychiatrists in Hobart.

The meeting heard from a number of eminent experts involved in recent Productivity Commission and Victorian government inquiries into Australia's fragmented and ailing mental health sector on workforce challenges to care.

The College also **launched** its **Rural Psychiatry Roadmap 2021-31** aimed at addressing marked disparities in access and outcomes for the one in five Australians who live outside major metropolitan centres.

Only six percent of all psychiatrists service this population, and the Congress heard that Australia's very remote areas were covered by just six specialists in total.

Breaking ground in rural training

Associate Professor Mat Coleman, who authored the roadmap and formally launched it in Hobart, said access gaps translated into poorer mental health outcomes across a range of indicators for rural and remote Australians, and contributed to shorter life expectancy and higher mortality rates.

“If you’re Aboriginal, your likelihood of suiciding is about three times the general population, but if you live rural and remote it’s about six times, another doubling,” Coleman told Croakey on the sidelines of the meeting. “You’re twice as likely to have an alcohol problem just by your postcode.”

Central to the roadmap is — for the first time in psychiatry and unprecedented among specialist training programs except for general practice — an end-to-end model allowing trainees to complete all their training in a rural location.

Currently, specialist training in Australia is built on a metro-centric model where trainees are attached to a metropolitan hospital and go on secondment to rural centres, an outdated paradigm which perpetuates rural workforce shortages by having training doctors tied to the cities during their most formative years of life.

“If the system is structured so that you have to be in a capital city during those years of your life you’re more than likely to remain there, it’s a fairly simple equation,” said Coleman, who lives on a farm four and half hours outside Perth.

Today at #RANZCP2021 we launched 'Rural Psychiatry Roadmap' which provides recommendations for implementation of a bi-national Rural Psychiatry Training Pathway. Extremely proud to have been part of the scoping committee for this project, under leadership of Prof Mat Coleman.

Unlike many specialist programs, which do genuinely require some, if not all, training years to be completed in a tertiary centre in order to practice niche and advanced skills, Coleman said psychiatry training could be entirely rurally provided, so long as appropriate supports and structures were in place. In an era of climate disasters, workforce demands would only become more acute.

"There are the opportunities and there's definitely the work and the experience," he said. "Rural communities have exactly the same sorts of problems that metropolitan people have in terms of prevalence of mental disorders.

"Sadly they do poorly in terms of suicide outcomes, substance use outcomes, and are at higher risk of the social determinants associated with mental health, but also trauma. Natural disasters tend to occur more frequently in rural communities — fires, floods, drought."

The roadmap also proposes a host of other measures including a Diploma of Psychiatry for GPs and other generalists wanting deeper or more specialised knowledge and skills in mental health.

Similar qualifications exist in women's and children's health, aimed at upskilling the primary care workforce to meet demand in these areas.

The roadmap also focuses on growing the Aboriginal and Torres Strait Islander workforce, an area — along with peer workers and nurses — identified as in major shortfall by the National Mental Health Service Planning Framework.

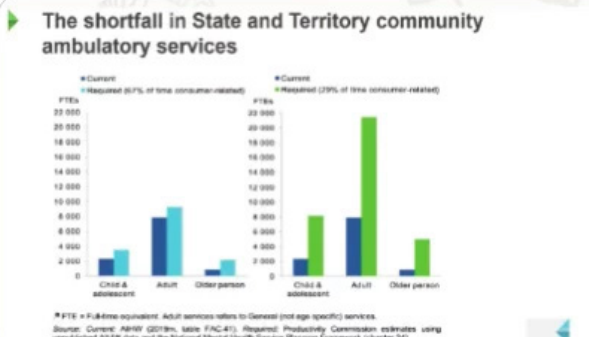

Professor Harvey Whiteford, who was at the helm of the Framework and Productivity Commission inquiry into mental health, discussed some of the findings around workforce.

Whiteford said it wasn't just a question of more workers, but appropriately deploying those already in the system to places of need, such as state and territory-based community ambulatory care. Lower-intensity services should play a bigger role, whereby you could achieve the same outcomes for less cost, but were not incentivised in funding terms.

Recs from [@ozprodcom](#) on Australia's mental health workforce. Psychiatrists, peer workers, Indigenous MH and nurses were biggest gaps, along with some of the subspecialty areas like child & adolescent, and rural [#RANZCP2021](#)

Productivity Commission recommendations

1. Align the skills and location of the workforce with needs of consumers.
2. Develop a national plan to increase the workforce, including psychiatrists.
3. Specifically in subspecialty areas & outside major cities
4. Develop an undergraduate degree in mental health nursing
5. Governments and Colleges to promote mental health as a career
6. Strengthen the role of the peer workforce in improving outcomes

Noting that you “don’t always need a psychiatrist”, Whiteford highlighted the value of family, carers, peer workers and community support workers in these settings, though he noted that rural areas and child and adolescent mental health were also desperately strapped for specialists.

At the nursing level, Whiteford said the Productivity Commission had advocated for a midwifery-style undergraduate qualification in mental health, allowing for direct entry to mental health nursing.

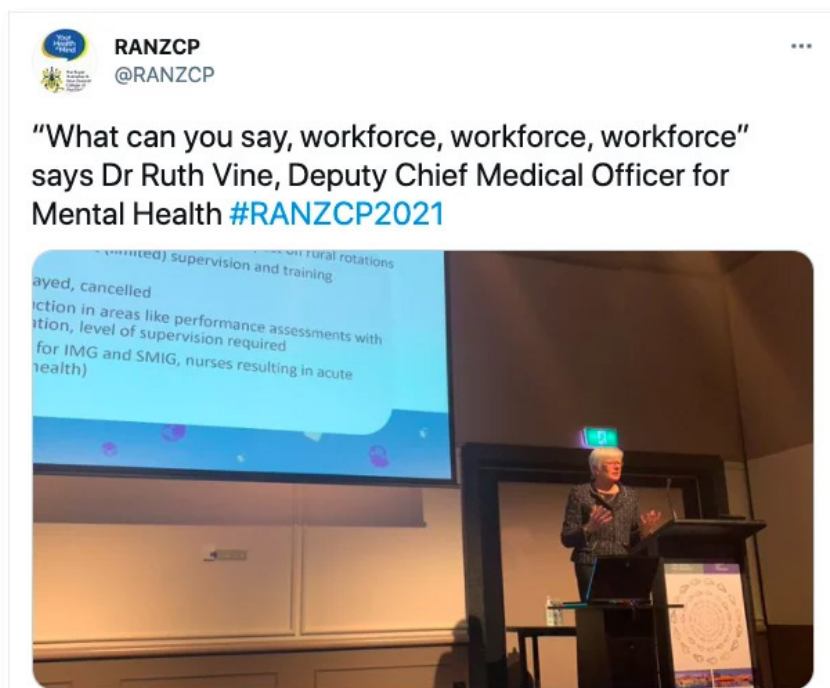

Without addressing workforce concerns, Whiteford said the broader ambitions of the Productivity Commission and related Royal Commission in mental health in Victoria would never get off the ground.

A flagging system swamped by demand

Dr Alex Cockram presided over the Victorian inquiry and shared some personal reflections, saying that nothing less than broad-scale reform was expected by consumers given the extent of failings documented by successive inquiries into the mental health system.

There was an appetite, too, from workers themselves, labouring under the moral injury of short-term medical models of care, in a flagging system swamped by demand, she said.

Dr Ruth Vine, Commonwealth deputy chief medical officer for mental health, said COVID-19 had brought these issues into sharp relief, with heightened levels of anxiety, stress, depression and burnout among the mental health workforce exacerbated by stressors including home schooling, lockdown, PPE and the transition to telehealth. The workforce was also strained by travel restrictions, hitting mental health nursing in particular, Vine added.

Growing demand was yet to abate, Vine said, with impacts most marked in Emergency Department/crisis settings and among younger people. Many psychiatrists worked through 2020 without a break, she said.

Vine said fragmentation and siloing was a major contributor to Australia's workforce issues, with stakeholders spanning state and federal jurisdictions, the public and private systems, and professional and peer cohorts, and the RANZCP itself.

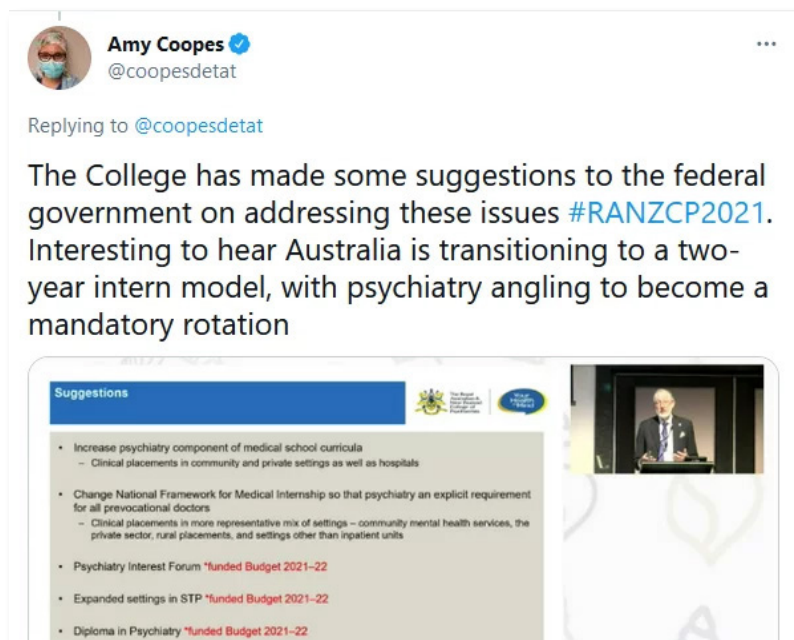

The National Mental Health Workforce strategy was examining these issues, and would be made public at the end of 2021, Vine said.

Cockram called for a system focused on "empathic, recovery-focused partnership", where needs were understood and supported, and access was provided to safe, restorative settings.

She also highlighted primary care as the foundation, not a sideline, of the mental health system.

In a specialty whose therapeutic work was founded on personal bonds, getting the right people into the right place was essential to turning disparities around, Coleman added.

“You are talking about an issue that’s all about trust and relationships and feeling safe with people,” he said.

What is behind these increases? Lack of appropriate alternatives, risk aversion, a paternalistic and restrictive culture in MH [#RANZCP2021](#)

Potential causes for increase in involuntary treatment

- Lack of systematized and well-resourced voluntary alternatives,
- Lack of early interventions
- Paternalistic and restrictive culture in mental health services,
- Risk aversion in clinicians and society (courier mail test or Pub test)
- Poor understanding of the concept of capacity to consent to treatment
- Prioritization of risk assessment over capacity assessment
- Legislative reform has not gone far enough
- Increase in drug-induced psychotic disorders and associated level of aggression
- Argument that increasing rate of involuntary treatment may be a good thing? access to services?

How does CRPD intersect with psychiatry? Involuntary treatment as a last resort, subject to safeguards. But CTO use in Australia high by international standards and rising, variation across states [#RANZCP2021](#)

Implications and critique

- Situations where the right to refuse treatment is in direct conflict with the right to health
- Legal capacity should be presumed, *unless* there is evidence to the contrary, through a range of checks and balances.
- Balance among the rights to autonomy, highest attainable standard of health and the right to life; and sometimes, the right of the children or community for safety.
- Minimisation of involuntary treatment and respect for autonomy and dignity
- Article 12(4) allows for involuntary psychiatric treatment as the last resort, under exceptional circumstances, with strong safeguards in place.

We have to deal with prevailing stigma and discrimination and elevate human rights, concludes Gill [#RANZCP2021](#)

Psychiatry, human rights and society

- How would human-rights based mental health legislation and the practice operate in the context of highly risk-averse media, politicians and society?
- The sensationalism of media against mental disabilities and risk-aversion in political circles both reflect ignorance and prejudice in society.
- Need strong advocacy for human rights, dispelling myths, and breaking down the barriers of stigma and discrimination, through public awareness-raising campaigns to promote mental health and social inclusion.
- A fair and equitable society, which respects the right to social inclusion of individuals with mental disabilities, and provides access to mental health promotion and early intervention would be the least likely to require involuntary/forensic treatment.
- Hence, prioritising positive rights would pave the way for the protection negative rights of people with mental disabilities.
